#### QUALITY & PERFORMANCE

Best video—at typical bitrates of 20Mb/s and up to 40Mb/s, for true Blu-ray quality picture.

Variable bitrates, typically less than 5Mb/s. Suffers from compression and video noise.

Best audio—lossless sound quality at bitrates up to 24.5Mb/s; support for Dolby TrueHD, DTS-HD Master Audio, and Linear PCM; up to 7.1 channels.

Highly compressed audio. Mostly stereo or 5.1 surround sound, with bitrates typically less than 512 Kb/s.

Designed for high-end audio/video components, premium speakers, projectors (including 2.35 support), and large screens.

Compressed audio and video optimized for lightweight entertainment on portable devices. Not suitable for a high-quality home theater experience.

Responsive and uninterrupted movie-watching experience, thanks to locally cached copy of the movie.

Performance dependent on Internet bandwidth and service provider's content distribution networks, resulting in buffering and unpredictable quality.
